Tests have been made to investigate the effectiveness of vortex generators in alleviating the adverse effects of shock-induced boundary layer separation. The variation in effectiveness of a flap control on an unswept wing in the transonic speed range was taken as a representative example of such effects since it lends itself easily to simple and reliable measurements by the free-flight technique.

Wingtip vortices are circular patterns of rotating air left behind a wing as it generates lift. One wingtip vortex trails from the tip of each wing. Wingtip vortices are sometimes named trailing or lift-induced vortices because they also occur at points other than at the wing tips. Indeed, vorticity is trailed at any point on the wing where the lift varies span-wise (a fact described and ...
